by the United Nations Children's Fund

The Inter-agency Group for Child Mortality Estimation (IGME) constitutes representatives of the United Nations Children's Fund, the World Health Organization, the World Bank and the United Nations Population Division. The child mortality estimates presented in this report have been reviewed by IGME members. As new information becomes available, estimates will be updated by the IGME. Differences between the estimates presented in this report and those in forthcoming publications by IGME members may arise because of differences in reporting periods or in the availability of data during the production process of each publication and other evidence. While every effort has been made to maximize the comparability of statistics across countries and over time, users are advised that country data may differ in terms of data collection methods, population coverage and estimation method used.

The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of UNICEF, the World Health Organization, the World Bank or the United Nations Population Division concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted lines on maps represent approximate border lines for which there may not yet be full agreement.

PROGRESS TOWARDS MILLENNIUM DEVELOPMENT GOAL 4: KEY FACTS AND FIGURES

- Overall, substantial progress has been made towards achieving MDG 4. The number of under-five deaths worldwide has declined from nearly 12 (11.7, 12.2)¹ million in 1990 to 6.9 (6.8, 7.4) million in 2011. While that translates into 14,000 fewer children dying every day in 2011 than in 1990, it still implies the deaths of 19,000 children under age five every day in 2011.
- Since 1990 the global under-five mortality rate has dropped 41 percent—from 87 (85, 89) deaths per 1,000 live births in 1990 to 51 (51, 55) in 2011. Eastern Asia, Northern Africa, Latin America and the Caribbean, South-eastern Asia and Western Asia have reduced their under-five mortality rate by more than 50 percent.
- The annual rate of reduction in under-five mortality has accelerated—from 1.8 (1.7, 2.1) percent a year over 1990–2000 to 3.2 (2.5, 3.2) percent over 2000–2011—but remains insufficient to reach MDG 4, particularly in Oceania, Sub-Saharan Africa, Caucasus and Central Asia, and Southern Asia.
- The highest rates of child mortality are still in Sub-Saharan Africa—where 1 in 9 children dies before age five, more than 16 times the average for developed regions (1 in 152)—and Southern Asia (1 in 16). As under-five mortality rates have fallen more sharply elsewhere, the disparity between these two regions and the rest of the world has grown.
- Under-five deaths are increasingly concentrated in Sub-Saharan Africa and Southern Asia, while the share in the rest of the world dropped from 31 percent in 1990 to 17 percent in 2011.
- By 2050, 1 in 3 children will be born in Sub-Saharan Africa, and almost 1 in 3 will live there, so the global number of under-five deaths may stagnate or even increase without more progress in the region.
- However, Sub-Saharan Africa has seen a faster decline in its under-five mortality rate, with the annual rate of reduction doubling between 1990–2000 and 2000–2011.
- About half of under-five deaths occur in only five countries: India, Nigeria, Democratic Republic of the Congo, Pakistan and China. India (24 percent) and Nigeria (11 percent) together account for more than a third of all under-five deaths.
- The proportion of under-five deaths that occur within the first month of life (the neonatal period) has increased 17 percent since 1990, from 36 percent to about 43 percent, because declines in the neonatal mortality rate are slower than those in the mortality rate for older children.
- Almost 30 percent of neonatal deaths occur in India. Sub-Saharan Africa has the highest risk of death in the first month of life and is among the regions showing the least progress.
- The leading causes of death among children under age five are pneumonia (18% of all under-five deaths); preterm birth complications (14%); diarrhoea (11%); intrapartum-related complications (complications during birth; 9%); and malaria (7%). Globally, more than a third of under-five deaths are attributable to undernutrition.

1. Values in parentheses indicate 90 percent uncertainty intervals for the estimates.

Introduction

It has been 12 years since world leaders committed to Millennium Development Goal 4 (MDG 4), which sets out to reduce the under-five mortality rate by two-thirds between 1990 and 2015. Only three years remain before the 2015 deadline. The world has made substantial progress, reducing the under-five mortality rate 41 percent, from 87 (85, 89) deaths per 1,000 live births in 1990 to 51 (51, 55) in 2011. However, this progress has not been enough, and the target risks being missed at the global level. The global under-five mortality rate needs to be reduced to 29 deaths per 1,000 live births—which implies an annual rate of reduction of 14.2 percent for 2011–2015, much higher than the 2.5 percent achieved over 1990–2011.

Still, in 2011, 6.9 (6.8, 7.4) million children died before reaching their fifth birthday. Almost two-thirds of them—4.4 million—died of infectious diseases, nearly all of which were preventable. In addition, inequities in child mortality between developing and developed regions remain large. In 2011 the under-five mortality rate in developing regions was 57 deaths per 1,000 live births—more than 8 times the rate in developed regions (about 7). Many countries still have very high under-five mortality—particularly those in Sub-Saharan Africa and Southern Asia, home to all 24 countries with an under-five mortality rate above 100 deaths per 1,000 live births. Reducing these inequities across countries and saving

more children's lives by ending preventable child deaths are important priorities.

This year, the governments of Ethiopia, India and the United States, in close collaboration with UNICEF, convened the Child Survival Call to Action Forum to mobilize political leadership to end preventable child deaths. Historical trends show that for most countries progress has been too slow and that only 15 of the 66 countries with a high under-five mortality rate (at least 40 deaths per 1,000 live births) are on track to achieve MDG 4. Millions of children still die each year from preventable causes and treatable diseases even though the knowledge and technologies for life-saving interventions are available. More than half the world's governments have pledged support for A Promise Renewed, committing to a global movement to end preventable child deaths so that more countries will achieve MDG 4 and all countries will sustain momentum beyond 2015.

As global momentum and investment for accelerating child survival grow, monitoring progress at the global and country levels has become even more critical. The United Nations Inter-agency Group for Child Mortality Estimation (IGME) updates child mortality estimates annually, and this report presents the IGME's latest estimates of under-five, infant and neonatal mortality and assesses progress towards MDG 4 at the regional and global levels.

Estimating Child Mortality

The UN Inter-agency Group for Child Mortality Estimation

The IGME was formed in 2004 to share data on child mortality, harmonize estimates within the UN system, improve methods for child mortality estimation, report on progress towards the Millennium Development Goals and enhance country capacity to produce timely and properly assessed estimates of child mortality. The IGME, led by UNICEF and the World Health Organization (WHO), also includes the World Bank and the United Nations Population Division of the Department of Economic and Social Affairs as full members.

The IGME's Technical Advisory Group, comprising leading academic scholars and independent experts in demography and biostatistics, provides guidance on estimation methods, technical issues and strategies for data analysis and data quality assessment.

Data sources and methodology

Generating accurate estimates of child mortality is a considerable challenge because of the limited availability of high-quality data for many developing countries. Vital registration systems are the preferred source of data on child mortality because they collect information as events occur and they cover the entire population. However, many developing countries lack fully functioning vital registration systems that accurately record all births and deaths. Therefore, household surveys, such as the UNICEF-supported Multiple Indicator Cluster Surveys and the US Agency for International Development-supported Demographic and Health Surveys, are the primary sources of data on child mortality in developing countries.

The IGME seeks to compile all available national-level data on child mortality, including data from vital registration systems, population censuses, household surveys and sample registration systems. To estimate the under-five mortality trend

series for each country, a statistical model is fitted to data points that meet quality standards established by the IGME and then used to predict a trend line that is extrapolated to a common reference year, set at 2011 for the estimates in this report. Overall, infant mortality rates are generated by transforming under-five mortality rates based on model life tables. Neonatal mortality rates are produced using a statistical model that uses under-five mortality rates as an input. These methods provide a transparent and objective way of fitting a smoothed trend to a set of observations and of extrapolating the trend over 1960 to the present. Details on these methods can be found in the PLoS Med Collection on child mortality estimation methods published in August 2012 (www.ploscollections.org/childmortalityestimation).

Changes in the estimation process

The IGME continually seeks to improve its methods and may introduce changes from one year to the next. This year, the IGME produced sex-specific estimates, added uncertainty intervals for the estimates and implemented other changes. Details can be found in CME Info (at www.childmortality.org).

In addition, a substantial amount of newly available data has been incorporated: data from more than 20 of the most recent surveys and censuses conducted since 2009 for more than 20 countries, new data from vital registration systems for about 70 countries and data from more than 50 surveys and censuses conducted before 2009 for more than 20 countries.

The increased data availability has substantially changed the estimates for some countries from previous editions partly because the fitted under-five mortality rate trend line is based on the entire time series of data available for each country. Furthermore, model life tables and a statistical model are used to derive estimates of infant and neonatal mortality rates based on under-five

Why does the IGME generate estimates on child mortality based on national data from censuses, surveys or vital registration systems but not directly use these national data as its official estimates?

- Many developing countries lack a single source of high-quality data covering the last several decades.
- Available data collected by countries are often inconsistent across sources. It is important to analyse, reconcile and evaluate all data sources simultaneously for each country. Each new survey or data point must be examined in the context of all other sources, including previous data.
- Data suffer from sampling or nonsampling errors (such as misreporting of age and survivor selection bias; underreporting of child deaths is also common). IGME assesses the quality of underlying data sources and adjusts data when necessary. In the absence of error-free data, there will always be uncertainty around data and estimates, both national and interagency. To allow for added comparability, the IGME generates such estimates with uncertainty bounds.
- The latest data produced by countries often are not current estimates but refer to an earlier reference period. This is particularly the case for estimates from the most recent national survey (such as a Demographic and Health Survey or Multiple Indicator Cluster Survey), which typically refers to a period before the survey year that is often several years before the target year of IGME estimates. Thus, the IGME also projects estimates to a common reference year.
- A consistent and comparable trend line from 1990 is needed for monitoring progress towards MDG 4 for each country.
- The IGME aims to minimize the errors for each estimate, harmonize trends over time and produce up-to-date and properly assessed estimates of child mortality.
- Applying a consistent methodology also allows for comparisons between countries, despite the varied number and types of data sources. One objective of the IGME is to provide valid and comparable child mortality estimates for policymakers. To do so, the IGME applies a common methodology across countries and uses original empirical data from each country but does not report figures produced by individual countries using other methods, which would not be comparable to other country estimates.
- All data, estimates and details on IGME methods are available on the Child Mortality Estimation Information (CME Info) website at www.childmortality.org.

mortality rates. Therefore, the estimates presented in this report may differ from and are not necessarily comparable with previous sets of IGME estimates or the most recent underlying country data.

Country consultation

A joint WHO–UNICEF country consultation was undertaken in August 2012 to give each country’s Ministry of Health and National Statistics Office the opportunity to review all data inputs and the draft estimates for their country. The objective was to identify relevant data not included in CME Info

and to allow countries to review and provide feedback on estimates; it was not, however, a country clearance process. In this round of country consultation process 95 of 195 countries showed interest and received the preliminary estimates; 61 of them provided comments or data; and estimates were revised for 30 countries using new data.

Capacity strengthening at the country level

Modelled estimates of child mortality can only be as good as the underlying data. IGME members, including UNICEF, the WHO and other UN

Examples of country data

Under-five mortality estimation is challenging in the absence of complete vital registration systems, as is the case in many developing countries. Existing data sources often suffer from various data quality issues, including underreporting of deaths, misreporting of ages, selection bias and other sampling and nonsampling errors. Below are examples of the real underlying mortality data used to calculate the estimates of the under-five mortality rate from countries with sparse data (Equatorial Guinea and Angola), a

country with abundant data but wide variations in the rates and trends between data sources (Nigeria) and a country with abundant data and small variations between data points (Senegal). The Senegal example also shows the trend line of the under-five mortality rate that results from the curve-fitting (black line) with the corresponding 90 percent uncertainty range (red band). Detailed graphs showing all the underlying data and the IGME trend estimates are available for all countries at www.childmortality.org.

agencies, are actively involved at the country level in strengthening national capacity in data collection, estimation techniques and interpretation of results.

Population-based survey data are critical for developing sound estimates for countries lacking functioning vital registration systems. The UNICEF-supported Multiple Indicator Cluster Surveys programme has been working since 1995 to build country-level capacity for survey implementation, data analysis and dissemination. The surveys are government owned and implemented, and UNICEF provides support through workshops, technical consultations and peer-to-peer mentoring. Some 230 surveys have been conducted in more than 100 countries. In addition to population-based surveys, the WHO and the UN Statistics Division work with countries to strengthen vital registration systems. UNICEF supports this work by promoting and monitoring progress in birth registration. The United Nations Population Fund provides technical assistance for population censuses, another important source of under-five mortality data.

The IGME strengthens capacity by working with countries to improve understanding of under-five mortality data and estimation. CME Info (www.childmortality.org), a comprehensive data portal on child mortality funded by UNICEF and

launched by the IGME, is a powerful platform for sharing underlying data and collaborating with national partners on child mortality estimates. Since 2008 a series of regional workshops has been held, training more than 250 participants from 94 countries in the use of CME Info as well as the demographic techniques and modelling methods underlying the estimates. In the last three years UNICEF and the IGME have sent experts to some 10 countries to conduct training on child mortality estimation. As part of the data review process, UNICEF's network of field offices provides opportunities to assess the plausibility of estimates by engaging in a dialogue about the estimates and the underlying data. WHO also engages its Member States in a country consultation process through which governments provide feedback on the estimates and their underlying data.

Guiding this capacity strengthening work is a fundamental principle: child mortality estimation is not simply an academic exercise but a fundamental part of effective policies and programming. UNICEF works with countries to ensure that child mortality estimates are used effectively at the country level, in conjunction with other data on child health, to improve child survival programmes and stimulate action through advocacy. This work involves partnering with other agencies, organizations, and initiatives such as the Countdown to 2015.

Levels and Trends in Child Mortality, 1990–2011

Under-five mortality has declined 41 percent since 1990

The latest estimates of under-five mortality from the IGME show a 41 percent decline in the global under-five mortality rate, from 87 (85, 89) deaths per 1,000 live births in 1990 to 51 (51, 55) in 2011 (table 1 and figure 1). Over the same period, the total number of under-five deaths in the world has declined from nearly 12 (11.7, 12.2) million in 1990 to 6.9 (6.8, 7.4) million in 2011 (table 2).

More than half the Millennium Development Goal regions have halved their under-five mortality rate since 1990

Five of nine developing regions show reductions in under-five mortality of more than 50 percent over 1990–2011 (figure 2). Eastern Asia, with a 70 percent reduction, and Northern Africa, with a 68 percent reduction, have achieved MDG 4, and Latin America and the Caribbean is close to

doing so with a 64 percent reduction. Sub-Saharan Africa, with a 39 percent reduction, and Oceania, with a 33 percent reduction, have further to go. However, Sub-Saharan Africa—also combating the HIV/AIDS scourge that has affected countries in the region more than elsewhere in the world—has doubled its annual rate of reduction from 1.5 percent over 1990–2000 to 3.1 percent over 2000–2011.

Under-five deaths are increasingly concentrated in Sub-Saharan Africa and Southern Asia

The share of under-five deaths that occur in Sub-Saharan Africa and Southern Asia is large and growing (83 percent in 2011). Of the 24 countries with an under-five mortality rate above 100 deaths per 1,000 live births in 2011, 23 are in Sub-Saharan Africa and the remaining one is in Southern Asia (map 1). Thus, substantial progress is

Oceania	74	67	61	56	51	50	25	33	1.9	1.8	1.9	Insufficient progress
World	87	82	73	63	53	51	29	41	2.5	1.8	3.2	Insufficient progress

Note: All calculations are based on unrounded numbers.

^a “On track” indicates that under-five mortality is less than 40 deaths per 1,000 live births in 2011 or that the annual rate of reduction is at least 4 percent over 1990–2011; “insufficient progress” indicates that under-five mortality is at least 40 deaths per 1,000 live births in 2011 and that the annual rate of reduction is at least 1 percent but less than 4 percent over 1990–2011. These standards may differ from those in other publications by Inter-agency Group for Child Mortality Estimation members.

MAP
1

Children in Sub-Saharan Africa and Southern Asia face a higher risk of dying before their fifth birthday

Note: This map is stylized and not to scale. It does not reflect a position by UN IGME agencies on the legal status of any country or territory or the delimitation of any frontiers.

needed in both regions to achieve MDG 4. In the coming years the number of under-five deaths in the world may stagnate or even increase without greater progress in Sub-Saharan Africa, because its number of live births and population of children under age five are set to grow rapidly. By 2050, 1 in 3 children will be born in Sub-Saharan Africa, and almost 1 in 3 will live there.

Half of under-five deaths occur in only five countries

Some 80 percent of the world's under-five deaths in 2011 occurred in only 25 countries, and about half in only five countries: India, Nigeria, Democratic Republic of the Congo, Pakistan and China. India (24 percent) and Nigeria (11 percent) together account for more than a third of under-five deaths worldwide.

Substantial progress has been made, but it is still insufficient to achieve MDG 4

Overall, substantial progress has been made towards achieving MDG 4. About 14,000 fewer children died every day in 2011 than in 1990, the baseline year for measuring progress. Improvement in child survival is evident in all regions. The number of countries with under-five mortality rates of 100 deaths per 1,000 live births or

higher has been more than halved from 53 in 1990 to 24 in 2011. In addition, no country had an under-five mortality rate above 200 deaths per 1,000 live births in 2011, compared with 13 in 1990. The annual rate of reduction has accelerated from 1.8 (1.7, 2.1) percent over 1990–2000 to 3.2 (2.5, 3.2) percent over 2000–2011. In Sub-Saharan Africa, the region with the greatest burden of under-five deaths, the annual rate of reduction has more than doubled. But these rates are still insufficient to achieve MDG 4 by 2015: only 6 of 10 regions are on track, and of the 66 countries with at least 40 deaths per 1,000 live births in 2011, only 15 are.

Moreover, disparity is growing between Sub-Saharan Africa and Southern Asia and the other regions

As under-five mortality rates have fallen more sharply in richer developing regions, the disparity between Sub-Saharan Africa and other regions has grown. In 1990 a child born in Sub-Saharan Africa faced a probability of dying before age five that was 1.5 times higher than in Southern Asia, 3.4 times higher than in Latin America and the Caribbean, 3.7 times higher than in Eastern Asia and 12.1 times higher than in developed regions. By 2011 that probability

was 1.8 times higher than in Southern Asia, 5.7 times higher than in Latin America and the Caribbean, 7.4 times higher than in Eastern Asia and 16.5 times higher than in developed regions. The disparity between Southern Asia and richer regions has also grown, though not as much.

The proportion of neonatal deaths is increasing as under-five mortality declines

Neonatal mortality, covering deaths in the first month after birth, is of interest because the health interventions needed to address the major causes of neonatal deaths generally differ from those needed to address other under-five deaths. Neonatal mortality is increasingly important because the proportion of under-five deaths that occur during the neonatal period is increasing as under-five mortality declines. Because declines in the neonatal mortality rate are slower than those in the mortality rate for older children, worldwide, the share of neonatal deaths among under-five deaths increased from about 36 percent in 1990 to about 43 percent in 2011, and the trend is expected to continue. While the relative increase is modest (17 percent) at the global level, there are differences across regions. The largest increases have been in Northern Africa

(42 percent) and Eastern Asia (33 percent); the smallest in Oceania (9 percent; table 3).

All regions are experiencing slower declines in neonatal mortality than in under-five mortality

Over the last 22 years all regions have seen slower reductions in neonatal mortality than in under-five mortality. Globally, neonatal mortality has declined 32 percent, from 32 deaths per 1,000 live births in 1990 to 22 in 2011—an average of 1.8 percent a year, much slower than for under-five mortality (2.5 percent per year). The fastest reduction was in Eastern Asia (61 percent), followed by Latin America and the Caribbean and Northern Africa (both 55 percent); the slowest in Oceania (23 percent), followed by Sub-Saharan Africa (24 percent; see table 3).

More than half the under-five deaths in Eastern Asia, Latin America and the Caribbean, and Southern Asia are neonatal deaths

In Eastern Asia, the region with the largest reduction in under-five mortality, neonatal deaths accounted for 57% of under-five deaths in 2011. In Latin America and the Caribbean neonatal deaths accounted for 53% of under-five deaths

TABLE 3 Neonatal mortality rate, number of neonatal deaths and neonatal deaths as a share of under-five deaths, by Millennium Development Goal region, 1990 and 2011

Region	Neonatal mortality rate (deaths per 1,000 live births)			Number of neonatal deaths (thousands)		Neonatal deaths as a share of under-five deaths (percent)		Relative increase (percent) 1990–2011
	1990	2011	Decline (percent) 1990–2011	1990	2011	1990	2011	
Developed regions	7	4	48	108	53	47	55	15
Developing regions	35	24	32	4,254	2,902	36	43	17

World	32	22	32	4,362	2,955	36	43	17

Note: All calculations are based on unrounded numbers.

in 2011. Both regions will have to scale up health interventions that tackle neonatal mortality in order to continue their success in reducing under-five mortality. Southern Asia also needs to address neonatal mortality: neonatal deaths account for more than half of under-five deaths, and almost 30 percent of global neonatal deaths occurred in India. Sub-Saharan Africa, which accounts for 38 percent of global neonatal deaths, has the highest neonatal mortality rate (34 deaths per 1,000 live births in 2011) and is among the regions that have shown the least progress in reducing that rate over the last two decades. Neonatal deaths there account for about a third of under-five deaths (1.1 million neonatal deaths), and greater emphasis should be on reducing both these deaths and other important causes of under-five deaths.

Systemic action is required to reduce neonatal mortality

With the proportion of under-five deaths during the neonatal period increasing in every region and almost all countries, systematic action is required by governments and partners to reach women and babies with effective care. Highly cost-effective interventions are feasible even at the community level, and most can be linked with preventive and curative initiatives for mothers and for babies. For example, early postnatal home visits are effective in promoting healthy behaviours such as breastfeeding and clean cord care as well as in reaching new mothers. Case management

of neonatal infections can be provided alongside treatment of childhood pneumonia, diarrhoea and malaria. Care at birth brings a triple return on investment, saving mothers, newborns and unborn children. Scaling up low cost solutions to address preterm birth could reduce these deaths by three-quarters, notably with antenatal steroid injections to women in preterm labour, and kangaroo mother care, where the preterm babies are held skin to skin with their mothers.¹

Coverage of effective interventions needs to be expanded

Accelerating the reduction in under-five mortality is possible by expanding effective preventive and curative interventions that target the main causes of post-neonatal deaths (pneumonia, diarrhoea, malaria and undernutrition) and the most vulnerable newborn babies and children. Empowering women, removing financial and social barriers to accessing basic services, developing innovations that make the supply of critical services more available to the poor and increasing local accountability of health systems are policy interventions that have allowed health systems to improve equity and reduce mortality. Countries in Sub-Saharan Africa and Southern Asia, in particular, need to place high priority on reducing child mortality.

Definitions

Under-five mortality rate: Probability of dying between birth and exactly five years of age, expressed per 1,000 live births.

Infant mortality rate: Probability of dying between birth and exactly one year of age, expressed per 1,000 live births.

Neonatal mortality rate: Probability of dying in the first month of life, expressed per 1,000 live births.

Note: Upper and lower bounds refer to the 90 percent uncertainty intervals for the estimates. Estimates are generated by the United Nations Inter-agency Group for Child Mortality Estimation to ensure comparability; they are not necessarily the official statistics of UN Member States, which may use alternative rigorous methods.

— not available.

a Estimates for Azerbaijan for recent years are based on projections from the 2006 Demographic and Health Survey and earlier surveys. Data from a more recent (2011) Ministry of Health survey are not yet available. Steps are being taken to improve death registration and to implement the international standard definition for live births. The most recent official infant mortality rate from the State Statistical Committee is 11 deaths per 1,000 live births for 2011, compared with the IGME estimate of 39.

b Estimates for Ecuador for recent years are based on projections from surveys and censuses. The most recent official national statistics are based on vital registration data and thus differ from the estimates shown here.

^c The results of the 2011 Georgia Reproductive Health Survey are not reflected in the estimates, pending further evaluation. The reported under-five mortality rate according to preliminary survey results is 16.4 per 1,000 live births for 2005–2010, compared with the IGME estimate of 24.

^d The results of the 2010–2011 Iran Multiple Indicator Demographic and Health Survey are not reflected in the estimates, pending further evaluation. The reported under-five and infant mortality rates according to preliminary survey results both show further improvement compared with IGME estimates for 2011.

^e Estimates for Kazakhstan for recent years are based on projections from surveys and censuses. The most recent official infant mortality rate, based on vital registration data, is 15 deaths per 1,000 live births for 2009, compared with the IGME estimate of 25.

^f Estimates for Tajikistan for recent years are based on projections from surveys and censuses. The most recent official infant and under-five mortality rates, based on vital registration data, are 12 and 14.8 deaths per 1,000 live births respectively for 2009, compared with the IGME estimates of 56 and 68.

^g The results of the 2012 Turkey Infant and Child Mortality Survey are not yet included in the estimates, pending further evaluation. The reported infant and under-five mortality rates according to preliminary survey results are 7.7 and 11.25 deaths per 1,000 live births respectively for 2007–2011, compared with the IGME estimates of 12 and 15 for 2011.

^h See next page for country classifications by region.

ⁱ The sum of the number of deaths by region may differ from the world total because of rounding.

Regional Classifications

The regional classifications that are referred to in the report and for which aggregate data are provided in the statistical table are Millennium Development Goal regions (see below). Aggregates presented for member organizations of the Inter-agency Group for Child Mortality Estimation may differ. Regions with the same names in different agencies may include different countries.

Developed regions

Albania, Andorra, Australia, Austria, Belarus, Belgium, Bosnia and Herzegovina, Bulgaria, Canada, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Monaco, Montenegro, Netherlands, New Zealand, Norway, Poland, Portugal, Republic of Moldova, Romania, Russian Federation, San Marino, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, The former Yugoslav Republic of Macedonia, Ukraine, United Kingdom, United States

Developing regions

Caucasus and Central Asia

Armenia, Azerbaijan, Georgia, Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, Uzbekistan

Eastern Asia

China, Democratic People's Republic of Korea, Mongolia, Republic of Korea

Latin America and the Caribbean

Antigua and Barbuda, Argentina, Bahamas, Barbados, Belize, Bolivia (Plurinational State of), Brazil, Chile, Colombia, Costa Rica, Cuba, Dominica, Dominican Republic, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, Trinidad and Tobago, Uruguay, Venezuela (Bolivarian Republic of)

Northern Africa

Algeria, Egypt, Libya, Morocco, Tunisia

Oceania

Cook Islands, Fiji, Kiribati, Marshall Islands, Micronesia (Federated States of), Nauru, Niue, Palau, Papua New Guinea, Samoa, Solomon Islands, Tonga, Tuvalu, Vanuatu

South-eastern Asia

Brunei Darussalam, Cambodia, Indonesia, Lao People's Democratic Republic, Malaysia, Myanmar, Philippines, Singapore, Thailand, Timor-Leste, Viet Nam

Southern Asia

Afghanistan, Bangladesh, Bhutan, India, Iran (Islamic Republic of), Maldives, Nepal, Pakistan, Sri Lanka

Sub-Saharan Africa

The UN Inter-agency Group for Child Mortality Estimation

The Inter-agency Group for Child Mortality Estimation (IGME) was formed in 2004 to share data on child mortality, harmonize estimates within the UN system, improve methods for child mortality estimation, report on progress towards the Millennium Development Goals and enhance country capacity to produce timely and properly assessed estimates of child mortality. The IGME, led by the United Nations Children’s Fund and the World Health Organization, also includes the World Bank and the United Nations Population Division of the Department of Economic and Social Affairs as full members.

The IGME’s independent Technical Advisory Group, comprising eminent scholars and independent experts in demography, provides technical guidance on estimation methods, technical issues and strategies for data analysis and data quality assessment.

The IGME updates its child mortality estimates annually after reviewing newly available data and assessing data quality. This report contains the latest IGME estimates of child mortality at the country, regional and global levels. Country-specific estimates and the data used to derive them are available at www.childmortality.org.
